Comment on the paper:

"Exports under the Flicker of the Northern Lights."

The paper addresses an interesting topic: why export patterns in small countries may differ from those in large countries. I find that the paper presents a convincing approach to the research question.

The theory provided is highly relevant to the subject matter, since the gravity model deals with both population (market) size and GDP (economic) size. The model also takes distance into account, which is important for Iceland because of its remote location.

The econometric approach also provides convincing results for this research.
