Bridging the digital divide in the G20: skills for the new age

Krish Chetty, Urvashi Aneja, Vidisha Mishra, Nozibele Gcora, and Jaya Josie

Abstract
The digital divide in general, and between women and men in particular, is a manifestation of exclusion, poverty and inequality, and is likely to continue because of the effects of unemployment, poorly functioning digital skilling programmes and socio-cultural norms in some economies, and further depriving women equal access to digital services. Digital skills provide the poor a catalyst to break out of the cycle of poverty and empower themselves. This paper considers a three-pronged digital skills strategy that will be required for developing countries to break out of the digital divide trap: (1) Monitor the evolving set of digital skills required for employment (2) incorporate a holistic digital skills development strategy into national education programmes, and (3) contextualize skilling programs within prevailing socio-cultural norms that will shape the uptake and impact of digital skilling programs.

1 Background

The digital divide is a manifestation of global inequalities. Those with greater capabilities can afford opportunities to gain the necessary skills to better leverage state and private sponsored investments in digital infrastructure and training. Conversely, impoverished communities with limited capabilities have fewer opportunities to gain the skills needed to advance within the rapidly transforming digital economy. With only 40% of the global population online, addressing the digital divide is a pressing global challenge. It should be particularly high-up on the G20 agenda as the top-three countries with the largest offline population – India, China, and Indonesia – are all G20 members (McCauley, 2017) (see Figure 1).

The link between digital access and socio-economic conditions is borne out by the South African example. In South Africa, 35% of households saw no relevance in accessing the internet, due primarily to their socio-economic circumstances (Statistics South Africa, 2015). It has also been noted that learners from families with high incomes have a greater affinity for using digital tools as compared to learners from low/middle income families. For example, Achuonye and Ezekoka (2011) discuss computer anxiety or ‘technophobia’ that learners from poorer communities in Nigeria exhibit when working with digital tools, simply due to the novelty of the occurrence. Similarly, Anthony, Clarke and Anderson (2000) argue that technophobia can be correlated against the user’s depth of computer experience.

Providing infrastructure in communities most affected by the digital divide will not alone resolve the problem of poor digital skills, or lead to an immediate adoption of such facilities. For example, it was found in Brazil, that despite providing more infrastructure, large parts of the population did not perceive a need for digital access (Marcus, Weinelt, & Goutrobe, 2015). On the contrary, studies show that digital training is the vital ingredient in harnessing the ICT infrastructure investments made by both the public and private sectors (Bowles, 2013).

Unless a concerted effort is made to educate the population about the benefits of digital technologies and how to operate such facilities, the current structure of the divided digital economy will exacerbate existing political and social inequities, particularly in low/middle income countries. An inclusive digital economy, that counters these divides, can lead to more trade, better capital use, improved efficiency, and accelerated innovation. To facilitate such benefits the G20 nations must take actions to address the challenges that maintain the digital divide.

Figure 1: Percentage of individuals using the internet

Source: International Telecommunication Union (2016)
In addition, socio-cultural factors strongly impede the access of digital tools by females. Johnson (2010) contends that in India for example, the low uptake of digital technologies by women is a result of prevailing roles, beliefs, and traditional norms. Son preferences within family units, community expectations, cultural norms that drive the sexual division of labour, such as a female’s role in the household duties and chores, increases the perceived opportunity cost of sending a girl to school. In India, 23% of girls drop out of school before they reach puberty. Consequently, these women are often not familiar with ICT and do not realize the value and empowering potential of ICTs (Gurumurthy & Chami, 2014). Other socio-cultural factors limiting women’s access and use of ICTs include discriminatory attitudes against women’s access to technology and technology education (Geertsema Sligh, 2006). For instance, a report by Intel (2013) titled ‘Women and the Web’ revealed that in 2012, one in five women in India thought internet usage to be inappropriate, non-beneficial and something that their families would disapprove of. In rural areas, negative questions that are often repeated are ‘What would a woman farmer want with a computer?’ Further, 40% of women in this study expressed discomfort or a lack of familiarity as a reason for not using the internet. In terms of ICT ownership, rural women are less likely to own communication assets, such as a radio or mobile phone, compared to their male counterparts. This is because they are less likely to allocate their income to use in public communication facilities, except when they need to communicate with family or to arrange for income transfers (Deen-swarray & Gillwald, 2012). The digital gender divide is thus, a combination of the lack of physical access, digital skills, opportunity and autonomy to make meaningful use of ICT, as these factors are strongly influenced by gender biased beliefs and value systems (Kularski & Moller, 2012).

The impact of ICTs in developing countries is also not gender neutral largely due to these entrenched socio-cultural norms and beliefs. In these cases, men tend to dominate access to employment, education and income sources and opportunities (Hilbert, 2011). However, as Hilbert suggests, an inclusive digital skills training programme must also provide opportunities for young girls to access the relevant basic skills valued by employers. However, without deliberate and focused programs for women and girls, the new digital economy will be exclusionary and reinforce existing gender and cultural disparities.

Considering the range of digitalization challenges affecting G20 countries, the strength of previous G20 recommendations to respond to these challenges has been weak in comparison. The issues of digitalisation and skills development have been raised consistently by the G20 but have not intersected prior to 2017. The G20 2015 Skills Strategy calls on G20 members to identify what skills are required by their respective labour markets whilst not explicitly mentioning digital skills (G20 Leaders, 2015). In contrast, the digital skills agenda is far more advanced in some European countries. For example, Germany’s Digital Agenda (2014-2017) provides a modern programme for training which includes professional development and the promotion of digital skills for all employees (German Federal Government, 2014). In addition, Europe’s Digital Agenda details the need for effective, contextualized formal education, training and certification systems. This is to promote a more inclusive digital society involving technical, social, cultural, civic and creative skill-sets (Helsper and Van Deursen, 2015).

In short, the G20’s position on Digital Skills lags behind the positions already adopted in developed nations. If the G20 was to adopt a stronger position on digital skilling, many low/middle income countries would benefit from such strategic guidance. Considering the
expanding role that digitalization will play in the economy the G20 must clarify its position on
digital skills development and take actions to align the digital skills requirements of employers
with those produced by education and training programmes.

2 Objectives

The G20 was formed in response to the Global Financial Crisis of 2008 to allow member
nations to collaboratively counter the emergence of future crises. The digital divide represents
such a potential crisis. Action is needed to resolve the gulf in digital skills attainment between
those with financial means and those without, however to date, policy priorities of the G20
pertaining to the digital divide have centred on optimising digital trade, financial inclusion and
infrastructure development. Whilst, the G20 has recognized the importance of skills
development, no connection was developed linking skills to the digital divide. It is the thesis of
this study, that the lack of digital skills particularly amongst poor communities is a crucial
determinant of digital exclusion. Whilst accepting that issues of infrastructure development and
the cost of Internet connectively must be addressed, due attention must also be directed to
upskill the population.

To address the skills gap that exacerbates the digital divide it is necessary to recognise the
multi-disciplinary nature digital skills required in the modern digital economy. A holistic skills
development programme across the G20 is required to align the needs of employers against the
supply of skills from training programme. This study identifies the pertinent skill-sets to be
supported by digital training programmes within schools, vocational training facilities,
universities and other training programmes across the G20. To do this, it will be important to
standardize the skills outputs of training programmes across the G20, allowing citizens to
receive training of comparable strength across G20 countries, in effect assisting to bridge the
digital divide across G20 nations.

While it is vital for the G20 nations to devise a holistic skills development programme, this
must include a conscious acknowledgement of country-specific social and cultural norms which
will shape the uptake of skilling initiatives. In some countries, such norms have the effect of
limiting women’s opportunities to access training programmes and can exacerbate the digital
divide if they are not adjusted to take account of the specificities of the limits to access to skills
by women. Keeping in mind the heterogeneity across emerging and developing economies it is
important to recognize these norms and to identify how the G20 can cooperate in forming and
executing common policies, as well as context-specific pathways to reduce digital exclusionary
practices.
3 Approach

The approach followed in this study involves a systematic review of international studies which describe the set of digital skills valued by employers. This study synthesizes the emerging commonalities for determining the broad set of digital skill’s disciplines. These skill-sets are associated with the type of employment opportunities available, and that are accessible when the associated level of skill is attained. In addition, relevant case studies are reviewed that discuss international best practices to developing an international skills training programme. Case studies from Asia and Africa are reviewed to assess the role of socio-cultural norms with a focus on those that impede women from using digital technologies.

In addition, a quantitative assessment was conducted of all new jobs advertised on South Africa’s premier recruitment website, www.CareerJunction.co.za. All relevant information describing the type of skills associated with the job advertisement, such as location, position, rank, salary and sector were extracted from the largely unstructured dataset. The information included in this analysis allows the determination of the toolsets and skill-sets required by employers in South Africa as of 18 May 2017 (the date of extraction). In future, this approach can be applied to other recruitment portals across the G20 to compare skill-set requirement differences amongst employers. The approach and analysis offers the G20 nations a practical solution to quantify the skills and tools needed, and can be adopted by an international standard setting body to determine which skills are needed as technology progresses over time.

4 Findings

4.1 The multidisciplinary nature of digital skills needed in the new age

It is widely accepted that there are multiple forms of digital skills required by employers. It is therefore necessary not to adopt a narrow conceptual view of digital skills but to rather describe the five key disciplines of digital skilling, viz., the Information, Computer, Media, Communication and Technology literacies which emerge from the literature surveyed in this study as discussed by the OECD (2016), Pirzada and Khan (2013), the UNESCO Institute for Information Technologies in Education (2011), Martin (2008), Covello (2010) and Bawden (2008), amongst others.

In short, the key disciplines which emerge are mentioned in Table 1. Furthermore, by acquiring generic skills within these disciplines, one has a better chance to gain access to entry level employment opportunities.
Table 1: Synthesis of digital skill disciplines

<table>
<thead>
<tr>
<th>Discipline</th>
<th>Description</th>
</tr>
</thead>
</table>
| Information | • Finding, evaluating, organising and using digital content.  
• Understanding the need for information and identifying what type of information is needed  
• Synthesising, creating new information |
| Computer | • Competence in using hardware and software tools.  
• Understanding access controls;  
• Ability to publish and communicate using available tools.  
• Using spreadsheets and word-processors.  
• Using IT tools for research and scholarship.  
• Ability to evaluate the benefits of new technologies. |
| Media | • Access, navigate, combine and edit text, sound, image and video media.  
• Integrating and comprehending sensory experiences.  
• Understanding graphic design principles  
• The nature of web authorship.  
• Critical analysis, evaluation and production of mass media content. |
| Communication | • Using and constructing hyperlinks between documents and/or images, sounds, movies,  
semiotic languages used in email, online chat space or in instant messaging.  
• Produce and critically evaluate ‘non-linear’ texts and navigating three-dimensional worlds online.  
• Communicating via multi-media platforms |
| Technology | • Ability to use technology within life situations.  
• Ability to adopt, adapt, invent, and evaluate technology to improve their livelihood and that of their community, and environment. |

4.2 Progressing from digital literacy to digital mastery

There are three tiers to digital skills, viz., literacy, fluency, and mastery. The digitally literate can conduct basic functions using a range of technical tools. The digitally fluent user is more digitally capable than the digitally literate user as the user can analyse and process multiple streams of information and operate at a more proficient level. The attainment of a level digital mastery is possible when fully utilizing the various digital tools at one’s disposal, and being able to produce new digital content (Ridsdale et al., 2015).

This three-tiered approach emphasized by the OECD (2016) identifies ICT generic skills attained at the level of becoming digitally literate, and ICT specialist skills which are attained at the levels of fluency and mastery. The OECD further identifies ICT complementary skills that are gained if learners can apply their skills in different work contexts. This type of skill usually manifests amongst employees that are at the fluent or master level.

It is crucial for low/middle income economies to ensure that disadvantaged communities receive the basic training needed to reach a state of digital literacy, however, once a state of literacy is attained, further training opportunities are needed to progress to levels of fluency and mastery. The most valued employees are those that can integrate digital tools seamlessly into their daily operational tasks. Thus, any digital skilling strategy must consider the longer-term requirements for mastery and the ability to apply such skills in other fields as well.

At a minimum, entry level jobs, needed in the modern economy require a broad set of generic skills, generally routine and manual in nature, related to information and computer skill-sets. Depending on the sophistication of the task, intermediate or expert level jobs often require
the employee possesses ICT specialist skills which, for example, allows the employee to programme, develop applications and manage networks. Jobs requiring problem solving abilities are not generally associated with entry level positions.

Importantly, the core skills needed, particularly in developing countries are the generic entry level skills linked to the information and computer skill-sets. These skills are considered gateway skills, enabling the learner to better grasp entry level concepts in other subject areas such as Media, Communication and Technology. The attainment of such digital skills, in addition to completing secondary schooling in South Africa, provides the learner the critical labour market access in the form of semi-skilled work opportunities, which breaks the cycle of poverty besetting poorer communities (Spaull, 2015). This stepping stone out of poverty can provide the learner further access to vocational training or universities. The absence of such skills denies the learner this vital initial access to formal employment.

### 4.3 Case study: South Africa’s digital skills needs

An analysis of junior positions in South Africa posted on www.CareerJunction.co.za allows the identification of the predominant skills required by employers. By applying the identified skills framework, it is possible to categorize the skill requirements of employers. Of the positions identified, it can be noted that technology discipline dominates new junior level positions across sectors, followed by careers requiring information and computer related skills (Table 2).

With respect to the information skills that are needed, tasks that require data manipulation were predominant, followed by the ability to find information on the Internet via database querying and an understanding of search engines. Junior positions that required data analysis and usage are commonly found in the Administration, Business Management, Finance, IT, Medical and Sales sectors (Table 3).

In terms of computer skills, the knowledge and ability to effectively work with Microsoft Office, particularly Excel, featured strongly. In this discipline, it was also found that knowing how to operate an Enterprise Resource Planning (ERP) system was particularly useful to employers. The Sage and SAP systems were often requested amongst junior positions. This is notable, as school, tertiary and vocational training programmes in South Africa do not offer training to operate an ERP system. Current training pertaining to ERP systems is limited as a part of an Information System’s course, with a greater emphasis on the design of such systems and not its operation. Operational skills are gained via on-the-job experience.

Media related skills were the least frequent set of skills required by employers in South Africa. In this discipline, it was noted that graphic design skills featured within the architecture and design type job advertisements. The majority of these positions are offered as permanent positions in the Finance, Design and Media, Marketing and Sales sectors. Such positions generally require the incumbent to concentrate on branding related activities.

Communications skills were also found to cut across sectors. The most prevalent requirement was the ability to write reports. Thus, the applicant needs to be capable in using a word processor. The expectation amongst these positions, is that the applicant is well-versed in
using the software and often using a tool such as Microsoft Word is not explicitly mentioned in the job advertisement. In addition to having strong writing skills, using new forms of technology to communicate was noted, with some positions requiring the applicants to be able to use Skype, social media in general, Twitter specifically, to be able to send messages as well understanding how to communicate using VOIP based tools.
Technology related skills were the most commonly requested skills from employers at the junior level. Database management skills are commonly required which is associated with using SQL for database querying and various other programming languages. It is also important for the applicant to understand the development principles for these types of jobs. Jobs with an annual income band of R54,000 to R120,000 were most common at the junior level. Interestingly, jobs where the applicant would earn up to R120,000 were found in sectors such as Sales (Retail), Finance and Administration and highlights that these skills can act as a gateway to employment in traditionally non-IT related sectors.

4.4 The need for a holistic skills development strategy

The challenge faced by all policy makers is to determine how to ensure policy making pertaining to digital skills development is as agile and responsive as the rapid pace of change in the international labour market. Employer requirements for new skills constantly change as the digital economy evolves. Consequently, any digital education minimum standards must be informed by a dynamic and responsive standard setting body. Such a body should serve as the link between employers, trainers, policy makers and academics (Figure 2). The duties of such a body would include (1) monitoring and identifying the skills requirements of resources required by employers, (2) guiding digital education and training programmes on the content of their curricula and (3) ensuring that academics and policy makers have an opportunity to debate the future direction and content of digital skills training programmes.

The literature suggests that businesses are holding training institutions responsible for not producing sufficient graduates with suitable digital skills (Calitz, 2010, Calitz, Greyling, &

Figure 2: Contributors to a digital skills standard setting body
Cullen 2014). This implies the need to align the demands of the employer with the curricula offered by secondary schools, vocational training facilities, digital training programmes and universities.

The OECD (2016) argues that when learners exit compulsory education they should be equipped with a proficient level of digital skills. In addition to identifying these skills, and what determines a suitable proficiency level, countries must also address the traditional challenges faced by the education sectors in low/middle income economies. These challenges include strengthening foundational skills such as literacy and numeracy, reducing school dropouts, targeting grade-repetition and promoting good teaching practices in schools. Further, in low/middle income economies, not all schools provide digital training to learners and such training, when available, may not be compulsory. In poorer communities, it is more commonly found that dropout rates are high, quality and infrastructure of schools are poor, and girls often do not receive sufficient schooling due to a combination of social and cultural norms (Spaull, 2015).

It is vital that G20 countries structure the school system and curriculum in a manner that is aligned with the needs of employers. In South Africa, the National Qualification Framework (NQF) structures the streams of education through ordinary schooling, adult education, vocational training and tertiary education. Compulsory education ends at Grade 9. Thereafter, a learner either continues in ordinary school or accesses either adult education or vocational training. Thus, the alignment discussed by the OECD must determine what skills should be offered to a learner exiting the school system from Grade 9/NQF Level 1 to students that complete a PHD/NQF Level 10.

Whilst South Africa’s NQF is aligned to international qualification frameworks such as the Bologna Process, the European Qualifications Framework and India’s NQF (European Commission - Education and Training, n.d., NUFFIC Internationalising Education, 2015) (see Table 4), it is important to determine the required digital skill, knowledge and competence that must be attained at each level via each education stream. In addition, private training programmes, not affiliated to their respective countries national qualification framework, should endeavour to align the content of their training programmes against the identified digital skills needs of employers.

Often, there is a lack of alignment between the various education streams. For example, in South Africa, it was found that there is a disconnect between the entrance requirements of higher education programmes and the Computer Applications Technology (CAT) subject offered in secondary schools (Mdlongwa, 2012). CAT is offered in Grades 10, 11 and 12 and the subject trains learners in a basic set of multi-disciplinary ICT skills. However, the subject is not credited by universities and therefore does not incentivise learners to enrol. The subject provides valuable training in areas such as software development, hardware maintenance and networking, however many poorer schools are ill-equipped to provide such training. Thus the holistic skills development strategy must cater for unaffordable requirements such as providing infrastructure, trained instructors, software, a maintenance plan, and insurance to combat effects of theft (South African Department of Basic Education, 2010).

Furthermore, the education programme in general needs to embed digitalisation across the curricula. The concerns of technophobia emanate from an unfamiliarity associated with digital technologies and services. Embedding and integrating digital tools into teaching practices in
earlier schooling phases will assist to overcome this unfamiliarity. A new practice-ready education paradigm is recommended to keep the education system responsive and agile to the ever changing emerging technologies (Calitz, 2010, Noel & Liub, 2017, Aflatoony & Wakkary, 2015).

#### 4.5 Responding to the gender divide & socio-cultural norms

While the digital divide exists in varying degrees across the G20, poorer communities and rural women in the developing world tend to be the least digitally included. For instance, only about 29 percent of internet users and 28 percent of mobile phone owners are women (Aneja & Mishra, 2017). In addition to the high cost of access to new technologies combined with the low level of female purchasing power, infrastructural constraints (the determining aspects of gendered digital exclusion in developing countries), are the impact of gender-biased belief and value systems that impose restrictions on the education and free mobility of women, indirectly exacerbating the digital skills divide (Mishra, 2017).

For instance, most ICT training centres are run from public spaces. Rural women are often reluctant or not allowed to visit “cyber cafes,” public internet centres, or community training centres that are often owned by men or visited predominantly by men. Further, training programmes often fail to take women’s ‘time poverty’ into account (Desai, 2016). Time poverty is defined as scarcity of time rural women face because of their multiple roles and heavy domestic responsibilities that limit the time they can allocate to learning and using ICTs. When training programmes run during early morning, or late evening hours, they limit women’s participation in training and education. There will be a greater chance for success if these factors are taken into account when designing digital training programmes.
In addition, Google, in association with TATA Trusts India, launched the ‘Internet Saathi’ campaign in July 2015 to bring 5 million women from villages online over a period of 18 months by teaching them how to use tablets and smartphones (Google India, 2015). While the exact number of women trained in sustained and productive usage of the Internet is unavailable, the programme was successful in familiarising and making the rural population comfortable with hardware and the Internet. What set the Internet-Saathi model apart was the fact that it only used local women as trainers. Having local women trainers ensured continuity in the process of learning and imparting hands-on training to women and children in villages. This approach made it a highly scalable and sustainable programme.

When designing digital training programmes, simply making these programmes accessible to women is unlikely to yield the desired results. The programmes must be context, and need-specific. For instance, investing in efforts to minimise the gender gap in science and technology education through such ‘ICTs in public schooling’ initiatives can be beneficial in urban contexts. At the same time, considering that a significant number of girls drop out of formal schooling post puberty (Gurumurthy & Chami, 2014), it is important to explore the potential of ICTs for educating out-of-school adolescent girls and supporting the learning-action processes of adult women who may not be textually literate.

Today, new technology can also be a skill-provider. When such tools are made available to women, it can reduce the gaps created through the formal education system. For instance, Barefoot College, a school in the North Western state of Rajasthan, India, provides professional training for rural women to use cell phones through innovative techniques where formal education or reading skills are not a prerequisite (Barefoot College, 2015). In this way, even illiterate, older local women entrepreneurs can use it in the marketplace.

In addition to generic digital skills training, there is a need to offer digital skills training programmes that highlight how women entrepreneurs can use and benefit from e-commerce services. E-commerce offers women the opportunity and flexibility to work from home. It eases not only the selling of products and services online, but can also promote the productivity and competitiveness of women entrepreneurs in rural and urban areas. This is done by linking producers and traders directly to markets at national, regional and even global levels, allowing them to restructure their economic activities and bypass intermediaries and the male-dominated and exploitative market structure (UNCTAD, 2002).

For instance, the Self-Employed Women’s Association (SEWA) Trade Facilitation Centre (STFC) in India showcases members’ products online, facilitates business-to-consumer sales, and builds business-to-business links through the use of ICTs and E-commerce (Self Employed Women’s Association, 2014). However, the extent to which women can control the transactions is unclear, making SEWA an intermediary as well. This necessitates research into what digital software applications and training capacities are needed to ensure that urban and rural women e-traders retain their agency, and avoid the same obstacles present in the economy in general.

However, it is also important to note that the gender dimension of digital exclusion can have varying manifestations. For instance, even in the US, where age, ethnicity and location are bigger determinants than gender in terms of digital access and usage, women’s underrepresentation in fields of science, technology, engineering, and mathematics (STEM) fields is a growing concern: only 18 percent of women earned a bachelor’s degree in engineering in 2012. STEM jobs are estimated to grow faster than any other sector in the future,
and it has been estimated that as many as 40 million jobs could go unfilled due to the emerging skills-gap (Dobbs et al., 2012). In addition to widening the existing deficit of women in high-skill technical jobs and research, the deficit of women in STEM fields is leading to new technologies being developed almost exclusively by men. Consequently, in-built sexism in artificial intelligence and robotics is already visible. If the present situation persists, it is likely to exacerbate existing inequalities in work opportunities and outcomes. Therefore, the focus needs to be on not only increasing women’s digital literacy, but also their digital mastery (Mishra, 2017).

5 Recommendations

5.1 G20 to monitor the digital skills required for employment

It is essential for the G20 nations to institute a process to identify and track the digital skills required by employers internationally. The G20 must recognise that the skills required by employers are multidisciplinary and pertain to the Information, Computer, Media, Communication and Technology literacies. It is the specific tools used in these spaces that rapidly evolve due improved efficiencies and innovative practices. In response, the G20 must introduce innovative mechanisms to follow the shifting trends in technologies required in the labour market to become more agile in the manner education programmes are structured. Monitoring the skills required should be conducted internationally and locally. This approach will allow countries to compare their current requirement against the international norms across sectors. Producing such insights will be beneficial to employers to benchmark their business practices and keep pace with the evolving international norm.

5.2 G20 to develop and guide a holistic digital skills upliftment strategy

In addition to monitoring skills required in the labour market across sectors, it is important to introduce agile processes which allow nations to collectively monitor and organise their respective education programmes to incorporate the new training requirements of employers. Setting up a broad G20 standard setting body will allow employers, trainers, academics and policy makers the opportunity to debate the future direction of the digital education curricula. This body will assist national qualification frameworks to find a common set of standards that apply across nations, allowing member countries to produce similarly skilled graduates, regardless of their location of study. Thus, providing poorer learners greater opportunities to access the labour market and breakout of poverty.

5.3 G20 nations to address the social and cultural norms

Advocacy and awareness generation programmes are necessary to challenge entrenched social attitudes and at the same time, concrete policy solutions need to be identified to improve
women’s socio-economic status. For this, the G20 must address the severe lack of funding to tackle pervasive social inequities. For instance, it was estimated that even though global aid is rising, aid to education has fallen 10% in 2009 to 6.9% in 2015. Crucially, at present only two G20 donor countries are dedicating the recommended 15 percent of their total aid to education (Johnston & Royle, 2017).

Secondly, it is clear that most studies on women’s empowerment and digital inclusion in the G20 context have remained anecdotal. There is a dearth of sex-disaggregated data on women’s access and usage of ICT, as well as of qualitative studies on attitudes and stereotypes that shape unconscious bias. While the Digital Opportunity Index (DOI) was introduced in 2005 to track digital inclusion, it does not collect sex-disaggregated statistics. There is an opportunity to undertake empirical research to map out future policy pathways. Lastly, as the case studies demonstrate, it is important that the G20 refrains from broad based brush-stroke solutions to tackle gendered digital exclusion.
